

Aurora provides the plant with the ability to intensify the pigmentation of fruits, vegetables, and flowers evenly. Aurora formulation comprises essential macro and micronutrients that encourage the plant to reduce maturation while increasing the quality of the overall crop during flowering and fruiting. Aurora works by stimulating the internal pathways of the plant and increasing the ability of the plant to synthesis essential nutrients that are responsible for the pigmentation.

### **SAFETY & ENVIRONMENTAL INFO**

Like any fertilizer, GROPRO encourages applicators to focus on appropriate land management and application practices. While our materials utilize superior formulations and ultra-low salt indexes, Aurora should be prevented from entering any lake, stream, well or river.

### **MODE OF ACTION**

Aurora delivers macro and micronutrients in optimal formulation and ratios to encourage and enhance the plant to increase the color pigmentation while reducing the plants' stress. With the elimination of Nitrogen from the formulation, Aurora does not force the plant into a growth stage but encourages the plant to translocate the nutrients that are in limited availability to promote reduced stress and an increased color formation.

### **EFFICACY**

- Increased even color formation
- Increased flower and fruit quality
- Increased harvestable crops
- Decreased harvest passes
