

Bio-Sweet is a metabolite Brix development aid. Bio-Sweet supports the formation of sugars inside the fruit, allowing for slow or stalled Brix formation to restart. This in turn allows for crops to be harvested earlier or in areas where maturity was affected.

### **SAFETY & ENVIRONMENTAL INFO**

Like any fertilizer, GROPRO encourages applicators to focus on appropriate land management and application practices. While our materials utilize superior formulations and ultra-low salt indexes, Bio-Sweet should be prevented from entering any lake, stream, well or river.

### **MODE OF ACTION**

Bio-Sweet is formulated with essential macro and micronutrients that are needed for the plant to develop sugars and ripen. The base of Bio-Sweet is Xylose, Mannitol, and Stevioside glycoside. These specific compounds encourage the plant to increase the absorption of semi bonded nutrients or nutrients that are not readily available. They also promote the absorption of carbohydrates without additional degradation or energy from the plant. Lastly, it encourages the formation of natural sugars allowing for an even maturity and Brix formation during stalled or slowed growth stages.

### **EFFICACY**

Increased Brix levels during slow maturity or reduced environmental situations.

Increased sell ability of crops

Decreased loss

Increased nutrient absorption
